Analyse the solution

- The free energy is $\kappa^{half-plane}(a) = -\log z_c(a)$.
- There are 2 phases characterised by density of visits:

$$\begin{array}{lll} \text{desorbed} & a \leq 2: & z_c = 1/2 & \text{and} & \rho = 0 \\ \text{adsorbed} & a > 2: & z_c = \sqrt{a-1}/a & \text{and} & \rho > 0 \end{array}$$

Owczarek Outline Colloids The model Finite *w* Half-plane Solution Analysis Mesoscopic scale Conclusions

Polymers in slits

Back to the full model — finite width slit

How to solve the full model

- Build the paths a row at a time
- Replace vertices in top row by zig-zag paths.
- Leads to (different) infinite set of functional equations

Rational form

$$L_w(z,a,b) = \frac{P_w(z,0,b)}{P_w(z,a,b)}$$

- $P_w(z, a, b)$ satisfies a simple linear recurrence.
- Related to Fibonacci polynomials.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

The solution of the full model

► This leads us to

$$L_w = \frac{(1+q)\left[(1+q-bq)-(1+q-b)q^w\right]}{(1+q-aq)(1+q-bq)-(1+q-a)(1+q-b)q^w}.$$
Where

$$q = \frac{1-2z^2 - \sqrt{1-4z^2}}{2z^2}$$

A similar analysis works for tails and bridges.

- Right-hand diagram: $n \to \infty$ and then $w \to \infty$.
- ▶ The order of *n* and *w* limits really does matter!

Polymers in slits

Owczarek

Outline

Asymptotics of free energy for large w

Special points

• We know $z_c(w)$ exactly at these points.

General a, b

- Can do asymptotic expansion of $z_c(w)$ for large w.
- ▶ e.g. For a, b < 2:

$$z_c(w) = \frac{1}{2} + \frac{\pi^2}{4} \frac{1}{w^2} + \frac{\pi^2(ab-a-b)}{(2-a)(2-b)} \frac{1}{w^3} + \cdots$$

For a > 2 and a > b:

$$z_c = \frac{\sqrt{a-1}}{a} - \frac{(a-2)^2(ab-a-b)}{2a(a-b)\sqrt{a-1}} \left(\frac{1}{a-1}\right)^w + \cdots$$

Polymers in slits Owczarek

Outline

Large w

There is more to come.

Mesoscopic scale

Large but finite *n* and *w*

- We now consider finite but large *n* and *w*.
- > To do this look at the partition function, defined via

$$L_w(z, a, b) = \sum_{n \ge 0} Z_n(w; a, b) z^n$$

We define the finite-length free energy by

$$\kappa_n(w; a, b) = \frac{1}{n} \log Z_n(w; a, b)$$

so that $\kappa(w; a, b) = \lim_{n \to \infty} \kappa_n(w; a, b)$.

Polymers in slits Owczarek Outline Colloids The model

Mesoscopic scale Finite *n* and *w* Scaling Analytic results

Conclusions

▲ロト ▲御 ト ▲ 臣 ト ▲ 臣 - の Q ()

Order of limits

The order of limits matters

► The infinite slit limit is

$$\kappa^{inf-slit}(a,b) = \lim_{w \to \infty} \kappa(w; a, b)$$
$$= \lim_{w \to \infty} \lim_{n \to \infty} \kappa_n(w; a, b)$$

whereas the half-plane limit is

$$\kappa^{half-plane}(a) = \lim_{n \to \infty} \kappa_n^{half-plane}(a)$$
$$= \lim_{n \to \infty} \lim_{w \to \infty} \kappa_n(w; a, b)$$

Polymers in slits Owczarek Outline Colloids The model Solution

Mesoscopic scale Finite n and w Scaling Analytic results Numerical results

Conclusions

▲ロ > ▲母 > ▲目 > ▲目 > ▲目 > ④ < ⊙

What we know

From now on we confine ourselves to $a, b \leq 2$.

Here we have

$$\kappa^{half-plane}(a) = \kappa^{inf-slit}(a,b) = \log 2.$$

So the limits do agree, but what about asymptotics?We have

$$Z_n^{half-plane} \sim A 2^n n^{\gamma-1}, \qquad \gamma = \begin{cases} -1/2 & a < 2\\ +1/2 & a = 2 \end{cases}$$

So

$$\kappa_n^{half-plane} \sim \log 2 + \frac{1}{n} \left[(\gamma - 1) \log n + \log A \right]$$

▲ロ > ▲母 > ▲目 > ▲目 > ▲目 > ④ < ◎

Polymers in slits Owczarek

Outline

Finite n and w

What we know

The asymptotics are different.

However for any finite w we have

$$Z_n(w; a, b) \sim B(w)\mu(w)^n,$$

where
$$\mu(w) = \exp(\kappa(w; a, b))$$
, $\lim_{w\to\infty} \mu(w) = 2$.
So

$$\kappa_n(w; a, b) \sim \log 2 + \log (\mu(w)/2) + \frac{\log B(w)}{n}$$

 $\sim \log 2 + \frac{1}{n}f(n, w)$

The scaling regime

Is there a scaling regime?

- Can we write f(n, w) as a function of a single variable?
- Does it match the various limiting asymptotic cases?
- A case of finite-size scaling.
- The mean vertex height at a = b = 1 is

mean height of vertex
$$\sim \sqrt{rac{\pi n}{8}} + O(1),$$

Hence we expect the scaling variable

$$\frac{w}{\xi_{\perp}} \propto \frac{w}{\sqrt{n}}$$

Conclusions

The scaling regime

Polymers in slits Owczarek Scaling

くりょう 御を ふぼや ふぼや ふりゃ

The scaling Ansatz

Scaling of κ and ${\mathcal F}$

▶ For $a, b \le 2$ and as $w, n \to \infty$ with fixed $x = \frac{w}{\sqrt{n}}$, we propose the Ansatz for the free energy:

$$\kappa_n(w; a, b) \sim \log 2 + \frac{1}{n} X(gx).$$

Differentiating wrt w gives an expression for the force

$$\mathcal{F}_n(w;a,b)\sim \frac{1}{n^{3/2}}Y(gx).$$

- The universal functions X(x) and Y(x) change if a or b equal 2.
- The constant g is a non-universal factor.

Polymers in slits Owczarek Outline Colloids Solution Analysis Mesoscopic scale Scaling

Matching the infinite-slit

Scaling of κ

Reiterating the Ansatz

$$\kappa_n(w; a, b) \sim \log 2 + \frac{1}{n} X(gx).$$

▶ For *w* fixed and large and $n \to \infty$ we recall that

$$\kappa(w; a, b) = \log 2 + \frac{e_1}{w^2} + O(w^{-3})$$

Owczarek Outline Colloids The model Solution Analysis Mesoscopic scale Finite *n* and *w* Scaling

Polymers in slits

Numerical resul

Matching the infinite-slit

Scaling of κ

Reiterating the Ansatz

$$\kappa_n(w; a, b) \sim \log 2 + \frac{1}{n} X(gx).$$

▶ For *w* fixed and large and $n \to \infty$ we recall that

$$\kappa(w; a, b) = \log 2 + \frac{e_1}{w^2} + O(w^{-3})$$

So if

$$X(x)\sim rac{e_1}{x^2}=rac{e_1n}{w^2}$$
 as $x
ightarrow 0^+$

then the scaling Ansatz matches the infinite-slit asymptotics.

くりょう 御を ふぼや ふぼや ふりゃ

Matching the half-plane

• What about $w \to \infty$ with *n* fixed and large?

Reiterating the Ansatz

$$\kappa_n(w; a, b) \sim \log 2 + \frac{1}{n} X(gx).$$

and the half-plane result

$$\kappa_n^{half-plane} \sim \log 2 + rac{1}{n} [(\gamma - 1) \log n + \log A]$$

Owczarek Outline Colloids The model Solution Analysis Mesoscopic scale Finite *n* and *w* Scaling Analytic results

Polymers in slits

Conclusions

Matching the half-plane

• What about $w \to \infty$ with *n* fixed and large?

Reiterating the Ansatz

$$\kappa_n(w; a, b) \sim \log 2 + \frac{1}{n} X(gx).$$

and the half-plane result

$$\kappa_n^{half-plane} \sim \log 2 + \frac{1}{n} \left[(\gamma - 1) \log n + \log A \right]$$

• After w > n/2, $Z_n(w; a, b)$ is a constant function of w.

So which limit do we really want?

$$w \to \frac{n}{2}$$
 or $w \to \infty$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへ⊙

Polymers in slits Owczarek

Outline

Analysis Mesoscopic scale Finite *n* and *w* Scaling Analytic results in progress?

An expression for the partition function

We can write

$$Z_n(w;a,b) = \frac{1}{2\pi i} \oint L_w(z;a,b) \frac{\mathrm{d}z}{z^{n+1}},$$

where L_w is a rational function.

So Z_n is a sum over residues at the zeros of the denominator of L_w — in the q variable these satisfy:

$$q^w = rac{(1+q-aq)(1+q-bq)}{(1+q-a)(1+q-b)}$$

- This is equivalent to a partial fraction expansion of L_w .
- However where are all the zeros?

Polymers in slits Owczarek

Outline

Colloids

Analysis Mesoscopic scale

Analytic results

A nice trick

A different expression

There is a 'trick' which is equivalent to moving the integration contour which gives the following expression for arbitrary a and b.

$$Z_{2\ell}(w;a,b) = \sum_{r=0}^{w} \sum_{s=0}^{\ell} \sum_{s_0,\ldots,s_w}' C_{2\ell,\ell^*} \binom{s}{s_0,\ldots,s_w} \alpha_r \prod_{m=0}^{w} \beta_m^{s_m}$$

where the multinomial sum is simply constrained, $C_{n,m}$ is a generalised Catalan number, ℓ^* is a simple function of ℓ and α_i and β_i are simple functions of a and b. Polymers in slits

A nice trick

A different expression

There is a 'trick' which is equivalent to moving the integration contour which gives the following expression for arbitrary a and b.

$$Z_{2\ell}(w;a,b) = \sum_{r=0}^{w} \sum_{s=0}^{\ell} \sum_{s_0,\ldots,s_w}^{\prime} C_{2\ell,\ell^*} \binom{s}{s_0,\ldots,s_w} \alpha_r \prod_{m=0}^{w} \beta_m^{s_m}$$

- We have summed over all Bethe roots without knowing them!
- This is pretty, but an asymptotic challenge!
- We are currently analysing the special cases a, b ∈ {1,2} where Z_n simplifies.

Polymers in slits Owczarek Outline Colloids The model Solution Analysis

Mesoscopic scale Finite *n* and *w* Scaling Analytic results Numerical results

Numerical analysis

Scaling function Y(x) for the force

The scaling Ansatz tells us that

$$\mathcal{F}_n(w; a, b) n^{3/2} \sim Y(gx) = Y\left(g\frac{w}{\sqrt{n}}\right),$$

in the limit $n \to \infty$ with x fixed.

- So Y(x) should be the same for all a, b < 2 seems to be the case
- and also same for other models in the universality class
 e.g. Motzkin paths in a slit.
- Y(x) different for (1,1), (1,2), (2,1) and (2,2) since there is a phase transition at a = 2 and also at b = 2.

Polymers in slits

Owczarek

Outline

Colloids

The model

Solution

Analysis

Mesoscopic scale Finite *n* and *w* Scaling Analytic results Numerical results

Y(x) is universal.

- Scaled force at (1,2) for Dyck paths and (1, ³/₂) for Motzkin paths.
- Data collapse for $w \in \{8, 16, \dots, 80\}$.
- Same scaling function (up to some constants) for both models.
- ▶ Note that *Y*(*x*) changes sign and is non-monotonic!

Conclusions

- ► We have found an exact solution for the g.f.
- The thermodynamic limits now well understood.
- The half-plane is not the same as the infinite-slit.
- The force-diagram has been mapped out.

Polymers in slits

Conclusions

- Finite-size scaling analysis in progress.
- Matching for small x (infinite-slit) appears to hold.
- Matching for large x (half-plane) as yet undetermined.
- ► Scaling analysis of partition function and generating function at special points a, b ∈ {1,2} is proceeding.
- Numerical analysis for a, b > 2 also underway.
- Some preliminary work for self-avoiding walks using FlatPERM.
- Of course we stand on Tony's shoulders...
