- Good/bad solvent: repelling/attracting interaction

A Model of a Polymer in Solution

Random Walk + Excluded Volume + Short Range Attraction

Collapse

Collapse			
0•			

A Polymer Phase Transition: Collapse (θ -point)

- Let the length of the polymer be n monomers so its mass $m \propto n$ and its spatial extension R
- Then one finds that mass m ~ R^d_{fractal} with d_{fractal} discontinuously dependent to temperature.
- A phase transition occurs as temperature is changed:
- Polymer Collapse, aka Coil-Globule Transition, aka Θ-Point

$$T > T_t$$
: good solvent swollen phase (coil): $d_{fractal} < d$

 $T = T_t$: Θ -polymer: $d_{fractal} \approx 2$

 $T < T_t$: poor solvent — collapsed phase (liquid-like globule): $d_{fractal} = d$

ISAW			

The Canonical Polymer Lattice Model

- Polymer → self-avoiding random walk (SAW)
- Physical space \rightarrow regular lattice eg \mathbb{Z}^3 or \mathbb{Z}^2
- Sites beads monomers not always valid

ISAW			

The Canonical Collapsing Polymer Lattice Model

Interacting Self-Avoiding Walk (ISAW)

- Start with a SAW and add 'interactions'
- Quality of solvent \rightarrow short-range interaction energy $-\varepsilon_{is}$
- Inverse temperature $\beta_{is} = \varepsilon_{is}/k_BT$
- Interactions are between (non-consecutive) nearest neighbours

ISAW			

Classical collapse transition

The θ point

- θ -point collapse transition is a critical phenomenon
- That is, a second order phase transition
- de Gennes' general description (1975) as a "tricritical point"
- Much work since on exponent values, scaling subtleties and various extensions

ISAW			
•••••• •••••			

Quantities of interest

The partition function

$$Z_n(eta) = \sum_{configurations} e^{etaarepsilon_{is}m_{nn}}$$

where m_{nn} is the number of nearest-neighbour pairs (contacts) and $-\varepsilon_{is}$ is the energy associated with each nearest neighbour pair. The free energy

$$\kappa_n(\beta_{is}) = \frac{1}{n} \log Z_n(\beta_{is})$$

and the thermodyanmic limit is

$$K(\beta_{is}) = \lim_{n \to \infty} \kappa_n(\beta_{is})$$

ISAW			
000000 00000			

Quantities of interest

The internal energy, which is the first derivative of κ_n with respect to β_{is}

$$u_n(\beta_{is}) = \frac{1}{n} \langle m_{nn} \varepsilon_{is} \rangle$$

with

$$U(\beta_{is}) = \lim_{n \to \infty} u_n$$

The specific heat, which is the second derivative,

$$c_n(eta_{is}) = rac{1}{n} \left(\langle m_{nn}^2 \, arepsilon_{is}^2
angle - \langle m_{nn} \, arepsilon_{is}
angle^2
ight)$$

with

$$C(\beta_{is}) = \lim_{n \to \infty} c_n$$

ISAW			
000000			

At fixed temperature

For any fixed temperature we expect

$$R_n^2 \sim A n^{2\nu}$$

the value of ν depends on the whether $T > T_t$, $T = T_t$ or $T < T_t$.

For $T \geq T_t$ we expect

$$Z_n \sim B e^{K \, n} n^{\gamma-1}$$

while for $T < T_t$ we expect

$$Z_n \sim Be^{Kn} e^{K_s n^{(d-1)/d}} n^{\gamma-1}$$

where K_s is a surface free energy.

The change in the exponents ν and γ herald a phase transition.

Multi-critical polymers

ISAW			
000000 00000			

Scaling in the three phases

At high temperatures — small β — Swollen Phase

In two dimensions, $\nu=3/4$ while $\gamma=43/32$

At the transition —
$$\beta = \beta_t - \theta$$
-**point**

In two dimensions, $\nu = 4/7$ while $\gamma = 8/7$

At low temperatures — large β — **Globule Phase**

In two dimensions, $\nu = 1/2$ while in three dimensions $\nu = 1/3$.

ISAW			
0000000 00000			

Scaling around the θ point

One expects that the singular part of the specific heat behaves as

$$C(T) \sim B|T_t - T|^{-\alpha}$$
,

where $\alpha < 1$ for a second-order phase transition. The singular part of the thermodynamic limit internal energy behaves as

$$U(T) \sim B|T_t - T|^{1-\alpha}$$
,

if the transition is second-order, and there is a jump in the internal energy if the transition is first-order (an effective value of $\alpha = 1$).

ISAW			
0000000 00000			

Scaling around the θ point

$$c_n(T) \sim n^{lpha \phi} C((T - T_t) n^{\phi})$$

with 0 $<\phi<1$ if the transition is second-order and

$$c_n(T) \sim n \mathcal{C}((T-T_t)n)$$

if the transition is first-order. The exponents α and ϕ are related via

$$2-\alpha=\frac{1}{\phi}\;.$$

ISAW			
000000 00000			

Scaling around the θ point in two dimensions

The work of Duplantier and Saleur (1987) predicted the standard θ -point behaviour in two dimensions, which has been subsequently verified Prellberg and Owczarek (1994). It is expected that

$$\phi=3/7pprox0.43$$
 and $lpha=-1/3$.

Note that this implies that the specific heat does *not* diverge at the transition. However, the third derivative of the free energy with respect to temperature will diverge with exponent

$$(1+\alpha)\phi = 2/7$$

ISAW			
000000 00000			

Adding stiffness to ISAW

Adding stiffness

- Models natural rigidity of polymers
- though it implies sites to monomer mapping is incomplete with adding stiffness
- In 1998 Bastolla and Grassberger studied the canonical model in three dimensions and added a weight for bends
- Later, in 2009, a model with weights for 'stiffness sites' studied by Krawczyk, Owczarek and Prellberg in two dimensions

Self-avoiding trails (SAT)

Trails, or bond avoiding walks, were introduced by Malakis in 1976 to model polymers with loops.

	ISAT		
	0000000		
	_		

History of SAT

Trails were studied by Shapir and Oono in 1984.

	ISAT		
	0000000		

ISAT on the square lattice

Interactions were added by associating an energy with doubly occupied sites — both crossings and touching.

	ISAT		
	0000000		

ISAT on the square latttice

The partition function

$$Z_n(eta) = \sum_{SAT} e^{eta arepsilon_{int} m_{int}}$$

where m_{int} is the number of intersections, both crossing and touchings are counted equally and $-\varepsilon_{int}$ is the energy associated with each intersection.

This leads to a single phase transition on varying β .

Kinetic SAT (KSAT)

A dynamic random walk model: a kinetic growth trail on the square lattice

Mapping to ISAT model

This kinetic growth trail gives configurations of SAT with a ISAT Boltzmann weight of $e^{\beta \varepsilon_{int}} = 3$. (H. Meirovitch, I. S. Chang, and Y. Shapir (1989) and Bradley (1990))

		ISAT		
		00000000		
Trans	sition			

Previous work, Owczarek and Prellberg 2006, on the square lattice has shown that there is a collapse transition with a strongly divergent specific heat, and the exponents have been estimated as

$$\phi = 0.84(3)$$
 and $\alpha = 0.81(3)$.

At $T = T_t$ it was predicted by Owczarek and Prellberg (1995) that

$$R_n^2(T) \sim An \left(\log n\right)^2$$
.

	ISAT		
	0000000		
• •			

Other ideas

- Grassberger and Hegger 1996 suggest renormalisation argument implies ISAT collapse is first order: they gave numerical evidence in three dimensions.
- Foster 2009 suggested that the mapping between grand ensemble and canonical is not straightforward with ν exponent not appped as normal.

	Tri-KSAT		
	•00		

Kinetic growth trails on the triangular lattice

An example of a trail with 13 steps on the triangular lattice. This trail has six singly visited sites, two doubly-visited sites and one triply-visited site (with probability $\frac{1}{5}\frac{1}{3}1$). This trail is produced by the growth process with probability $(\frac{1}{6})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}{5})(\frac{1}$

	000		

Fluctuations in KSAT

	Tri-KSAT		
	000		

Doubly and Triply Visits

Figure: Plot of the average numbers of doubly, $e_2(n)$, and triply, $e_3(n)$, visited sites against $1/n^{0.133}$. Their asymptotic values, $E_2 = 4/35 \approx 0.114$ and $E_3 = 8/35 \approx 0.228$ respectively are marked as filled circles.

		Canonical model	

Canonical Model

Associate an energy $-\varepsilon$ with each doubly-visited site and an energy -2ε with each triply-visited site. For each SAT we count the number $m_2(\varphi_n)$ of doubly-visited sites and $m_3(\varphi_n)$ of triply-visited sites of the lattice and give that configuration a Boltzmann weight $\omega^{m_2+2m_3}$, where $\omega = \exp(\beta\varepsilon)$.

The partition function of the canonical ISAT model is then given by

$$Z^{(2)}_n(\omega) = \sum_{SAT} \omega^{m_2+2m_3} \; .$$

		Canonical model	
		•0	

Collapse transition for tri-ISAT

Figure: Plot of the value of the maximum of the specific heat $c_n = \max_{\omega} c_n^{(2)}$ against log *n*. This suggests that the specific heat does not diverge as the polymer length is increased.

		Canonical model	
		0•	

Free Energy Third Derivative

Figure: Plot of the height of the peaks of $t_n^{(2)}(\omega)$, the third derivative of the free energy with respect to temperature against *n*. The third derivative has two peaks: one positive and one negative in value.

Therefore it is tempting to conjecture that the canonical ISAT model on the triangular lattice has a collapse transition that lies in the θ -point universality class, rather than square lattice ISAT collapse universality class.

		elSAT	

The extended model of self-interacting trails (eISAT)

We associate an energy $-\varepsilon_2$ with each doubly-visited site and a different energy $-\varepsilon_3$ with each triply-visited site. For each SAT we assign a Boltzmann weight $\omega_2^{m_2}\omega_3^{m_3}$, where $\omega_j = \exp(\beta\varepsilon_j)$.

The partition function of the eISAT model is then given by

$$Z_n(\omega_2,\omega_3) = \sum_{SAT} \omega_2^{m_2(\varphi_n)} \omega_3^{m_3(\varphi_n)}$$

We can define a one temperature family paramerized by k, where $\omega_3=\omega_2^k,$ with

$$Z_n^{(k)}(\omega) = \sum_{SAT} \omega^{m_2(\varphi_n) + km_3(\varphi_n)} .$$

The canonical model has k = 2

		elSAT	
		•000 00 00 00 0000	

KSAT mapping

The KSAT progress gives SAT configurations with Boltzmann weights

 $\omega_2 = 5/3$ and $\omega_3 = 25/3$

Alternatively

$$\omega = 5/3$$
 with $k = k_G \equiv \frac{\log(25/3)}{\log(5/3)} \approx 4.15 \neq 2$.

So the KSAT process does not map to any temperature of the canonical ISAT on the triangular lattice.

		elSAT

_			

Conclusions

By studying an extended ISAT model on the triangular lattice we have found

- three phases: swollen, globule and crystal-like
- similar to semi-flexible ISAW despite stiffness is absent
- the meeting point of three phase boundaries seems multi-critical
- Kinetic growth dynamic model gives this multi-critical point exactly
- Square lattice ISAT model only has this multi-critical point
- Now investigating cubic lattice (with Andrea Bedini)

			Conclusion
